<b>3</b>	<b>Indices and tables</b>	<b>7</b>

Python wrapper for `libpg_query`

---

**CHAPTER  
ONE**

---

**INSTALLATION**

```
pip install pgparse
```

## DOCUMENTATION

## 2.1 API

The pgparse API is a direct wrapper of the functions provided by `libpg_query`.

### 2.1.1 Functions

### 2.1.2 Exceptions

## 2.2 Examples

The following snippet demonstrates how to get a query fingerprint, return a normalized query, parse SQL, and parse a PL/pgsql function.

```
import pprint

import pgparse

sql = "SELECT * FROM pg_catalog.pg_class WHERE relname = 'foo'"
print('Fingerprint: {}'.format(pgparse.fingerprint(sql)))
print('Normalized: {!r}'.format(pgparse.normalize(sql)))
parsed = pgparse.parse(sql)
pprint.pprint(parsed)

func = """\
CREATE FUNCTION sales_tax(subtotal real) RETURNS real AS $$
    BEGIN
        RETURN subtotal * 0.06;
    END;
$$ LANGUAGE plpgsql;
"""
parsed = pgparse.parse_pgsql(func)
pprint.pprint(parsed)
```

## 2.3 Version History

Version	Date	Release Notes
0.2.0	2021-02-23	Update to libpg_query 13-latest-develop, fix building in Alpine
0.1.0	2019-07-09	Initial release
